

CME Web

How it works...

On request, your local software exports and compresses data for upload to the internet. Once uploaded, a searchable online catalogue is accessible 24/7 to researchers!

Data Security...

- Absolute! This online catalogue exists outside your network and is only a copy of your resource data
- No borrower information is uploaded or stored by this catalogue
- Access can be restricted by setting a catalogue password

What makes it special...

- Can accept data from several Library systems (contact us to discuss!)
- Basic, uncluttered layout
- Surprisingly effective built-in cross-referencing for brainstorming
- Concept Maps
- Optional inclusion of Weblinks database of educationally evaluated websites
- Email based reservations and confirmations

Our Company...

Who are we?

We started with three Teacher/Librarians building Resource Management Systems in the 80's using a DOS platform and floppy disks to move data around. As Windows® networking became more reliable, we developed software to maximise distribution and usability while minimising downtime.

The online, browser based environment has been embraced by our CME-Web OPAC that works using data from several different Library Systems.

Education is our passion and our software has been built with this as a focus. Development continues with an open mind...

As software developers we:

- saw a need and work towards a solution...
- recognise that needs constantly change and regularly demonstrate our ability to provide for that change...
- believe user support is what makes software truly useful...

We've been doing this for 20 years and, as a client, you help us choose a path to the future.

The LibCode Team

LibCode Suite

(Windows® based Resource Management System)

Your Library is an amazing place! It contains information about, or at least a reference to, everything any human has ever written about...

Do you have a Library System that encourages young minds to explore it?

The LibCode Suite:

- Assists Teachers to create Related Ideas lists when developing themes and units
- Allows researchers to view a list of related topics not covered by your resource collection to encourage exploration via other avenues
- Allows you to demonstrate lateral thinking and concept mapping
- Helps a potential time wasting search on Koalas become a genuinely interesting discovery of Chlorofluorocarbons - Environmental aspects
- Gives you the option of a remotely hosted web-based OPAC (no problems with EQ Network policies!)

We're not sure how to present our enthusiasm on this page so you'll need to call us for a demonstration!

TextTracker Suite

(Windows® based Textbook Management System)

Looking after a Textbook collection presents many different issues to that of a Library Collection.

Text Tracker Suite has been designed specifically to address these requirements giving you the ability to:

- Store Department details along with resource information
- Search and locate resources using Topics or Subject areas (e.g. English)
- Quickly add multiple copies
- Run from several locations around the school via your existing network
- Produce individual unreturned loan notices for borrowers including replacement value
- Generate Resource Audit lists by subject area (e.g. English)
- Perform a partial or complete Stock take (designed for use with portable barcode readers!)

This is a different package to LibCode. You do not need to be using LibCode in the Library to use TextTracker for your Textbooks!
